

Simulation-based View Analysis

Christoph Reinhart, Jon Sargent (Solemma), Irmak Turan (IIT), Nada Tarkhan (MIT)

CBE Symposium on Window Views, Oct 13 2021

Introduction View Metrics

- A view is a universally recognized asset for **building occupants**, **architects** and **real estate**. However, each group different outlook/motivation to pursue view. Metrics might help to clarify what may constitute a good view.
- According to the symposium organizers: “the design industry lacks a **holistic** evaluation method of assessing the many qualities of a window view (e.g., content, accessibility, clarity)”
- So, what do we know and what is missing?

Computational Design Approaches to View

Content

Accessibility

Clarity

- Objects of interest are tagged
- Content is analyzed at discrete viewpoints via raytracing

View score

ClimateStudio LEED 4.1 Quality Views

A LEED Quality View meets the following two criteria:

Type 2: Can see 2 of 3 through vision glass:

- *Nature / Art / Urban landmarks*
- *Objects > 25 ft.*

Figure: J. Sargent (Solemma)

ClimateStudio LEED 4.1 Quality Views

A LEED Quality View meets the following two criteria:

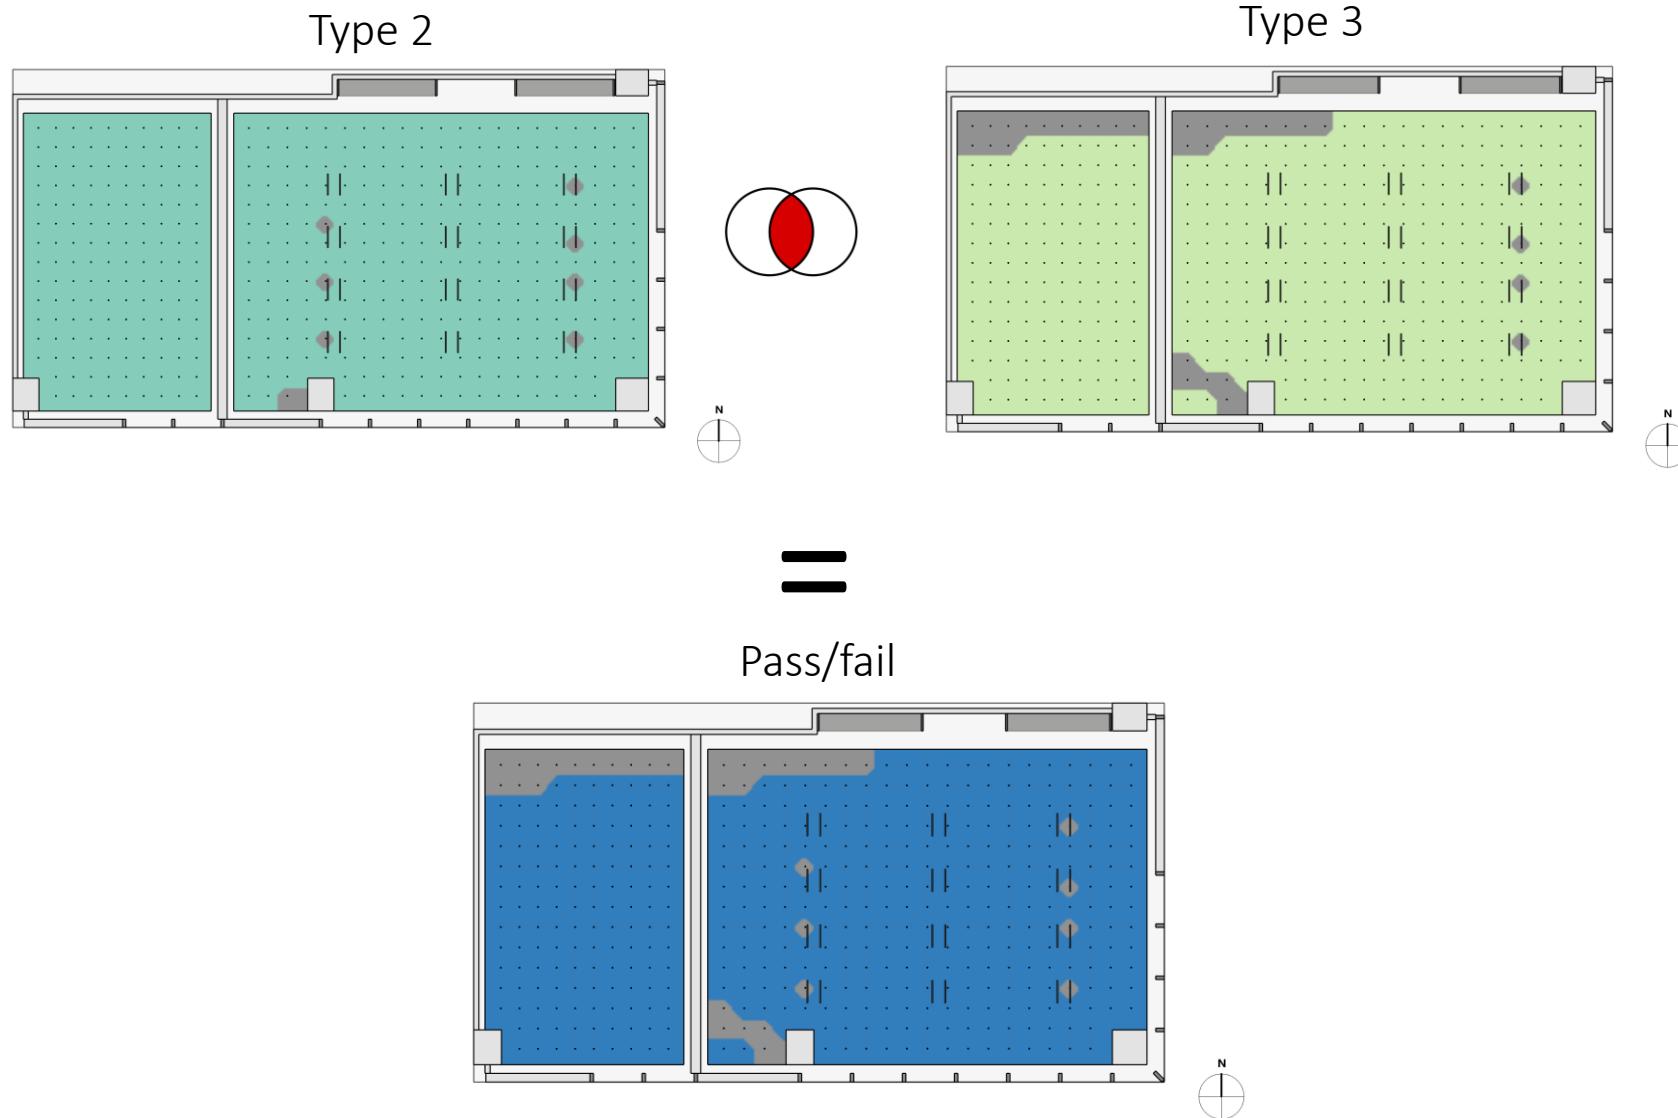

Type 2: Can see 2 of 3 through vision glass:

- *Nature / Art / Urban landmarks*
- *Objects > 25 ft.*

Type 3: Within 3 x vision glass head height

ClimateStudio LEED 4.1 Quality Views

Computational Design Approaches to View

Content

- Objects of interest are tagged
- Content is analyzed at discrete viewpoints via raytracing;

**It remains unclear whether these metrics
correspond to occupant evaluations of spaces**

The Value of Daylight in Office Buildings

How can we overcome the conflict between carbon emissions and economics?

The Value of Daylight in Office Buildings

$$\log P_i = \alpha + \beta X_i + \delta g_i + \varepsilon_i$$

Price

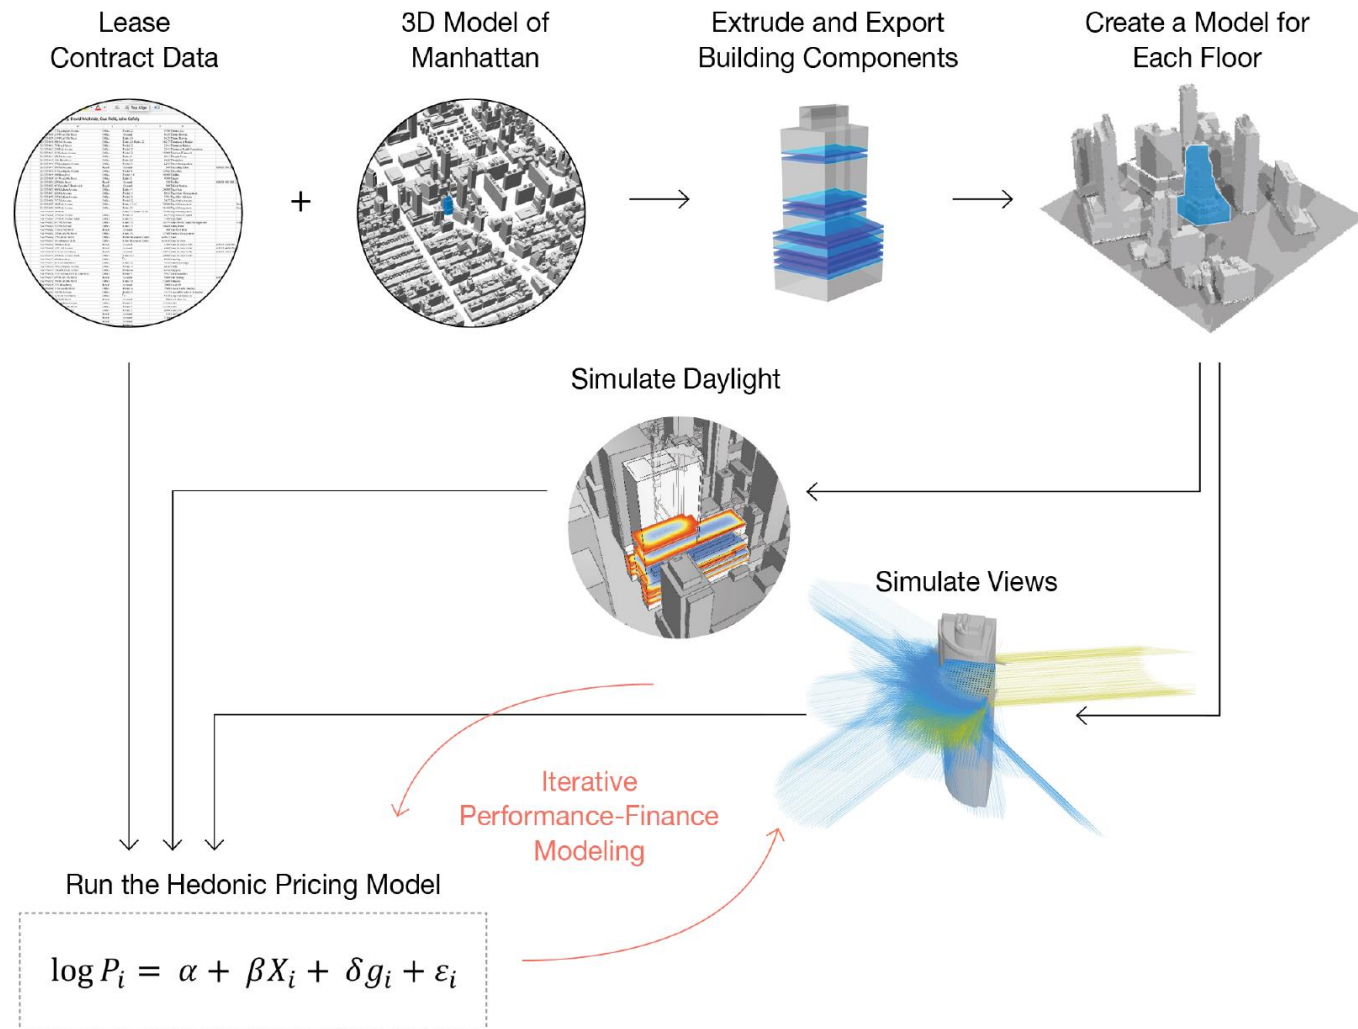

Factor in question
(e.g. daylight availability)

Hedonic characteristics include:

property type; age; building class; number of floors;
renovations; amenities; transportation accessibility;
investor type

- Spaces with access to high amounts of daylight (sDA > 55%) have a 5 to 6% value premium over occupied spaces with low amounts of daylight (sDA < 55%)

The Value of Daylight & View in Office Buildings

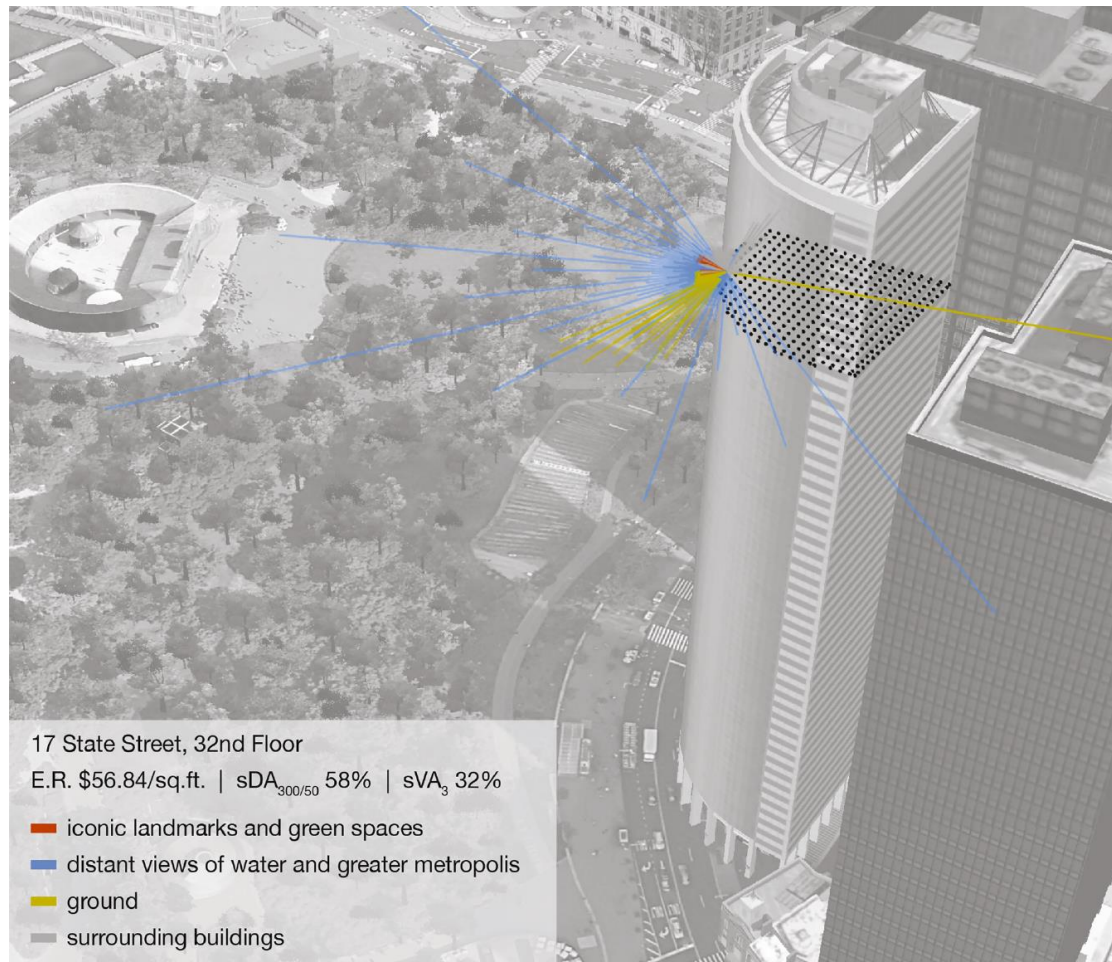

The Value of Daylight & View in Office Buildings Proposed View Metrics

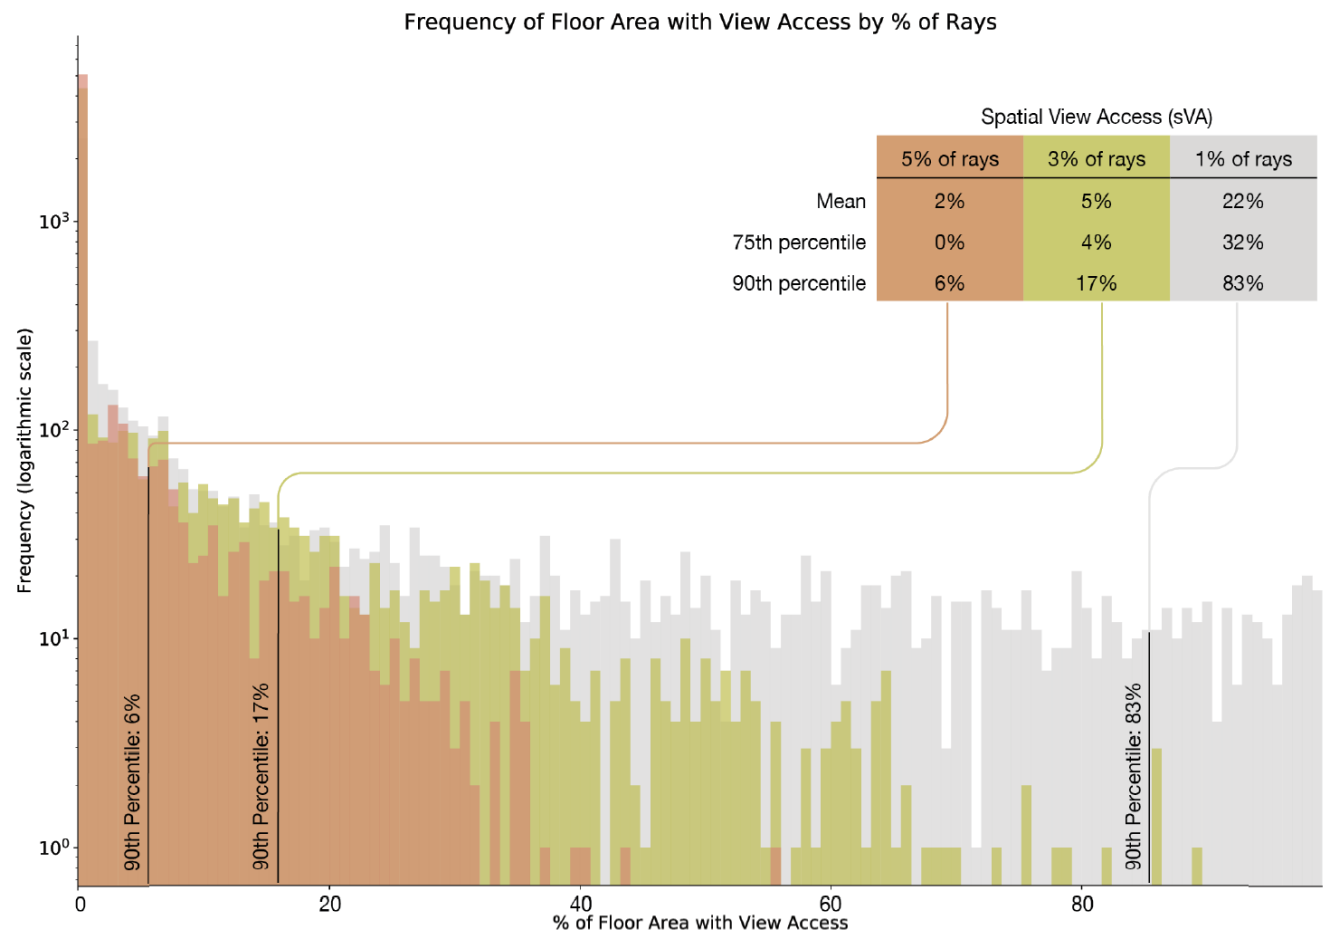

- Question 1: What is required number of content rays for a location to have a “minimum view potential”?

The Value of Daylight & View in Office Buildings Proposed View Metrics

- Question 2: What percentage of a space needs to have a “view” for the overall space to have “spatial view access”?

The Value of Daylight & View in Office Buildings Proposed View Metrics

- We decided that 3% MVP and 10% sVA3 correspond to high view access. In our dataset 16% of spaces accordingly have a “view”.

The Value of Daylight & View in Office Buildings Combined Results

- The results show that spaces with high levels of daylight (55% and above sDA300/50%) have a **5 to 6% premium** over spaces with low daylight (less than 55% sDA300/50%).
- Spaces with high access to views (10% and above sVA3) have a **6% premium** over spaces with low access to views (less than 10% sVA3)
- The combined value of spaces with **both** high daylight and view access, similarly, is **6%**, indicating that the impact of daylight and views together is significant but is not additive.

What do different view metrics reward?

View Metric Comparison

LEED v4.1

Metric Scale: Yes/No

Compliance: Both Type 2 (context & sky) and Type 3 (unobstructed) for at least 75% of regularly occupied area

Components Considered:

- Sky	Yes
- Ground	Yes
- Vegetation/Nature	Yes
- Art	Yes
- Urban landmarks	Yes

EN 17037

Metric Scale: Fail/Min/Med/High

Compliance: 3 assessments included; horizontal sight angle, outside view distance and Number of view layers

Components Considered:

- Sky	Yes
- Ground	Yes
- Vegetation/Nature	Yes
- Art	No
- Urban landmarks	Yes

MVP > 3%

Metric Scale: 0-100%

Compliance: Measures the % of view (by solid angle) occupied by a specific feature. 10% sVA with a 3% MVP.

Components Considered:

- Sky	Yes
- Ground	Yes
- Vegetation/Nature	Yes
- Art	Yes
- Urban landmarks	Yes

Façade Geometry Comparison

Fully Glazed

Inset Windows

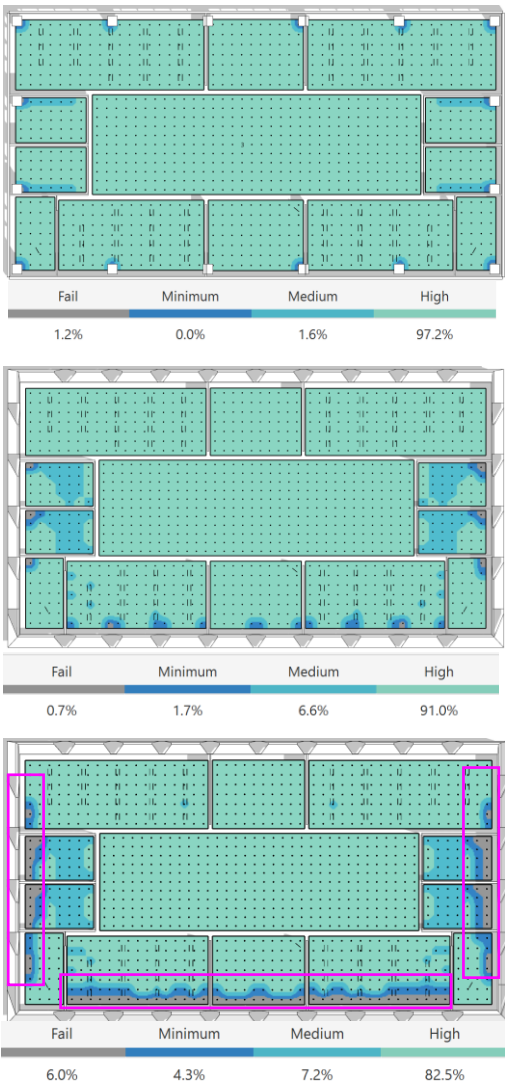

Inset with Shading

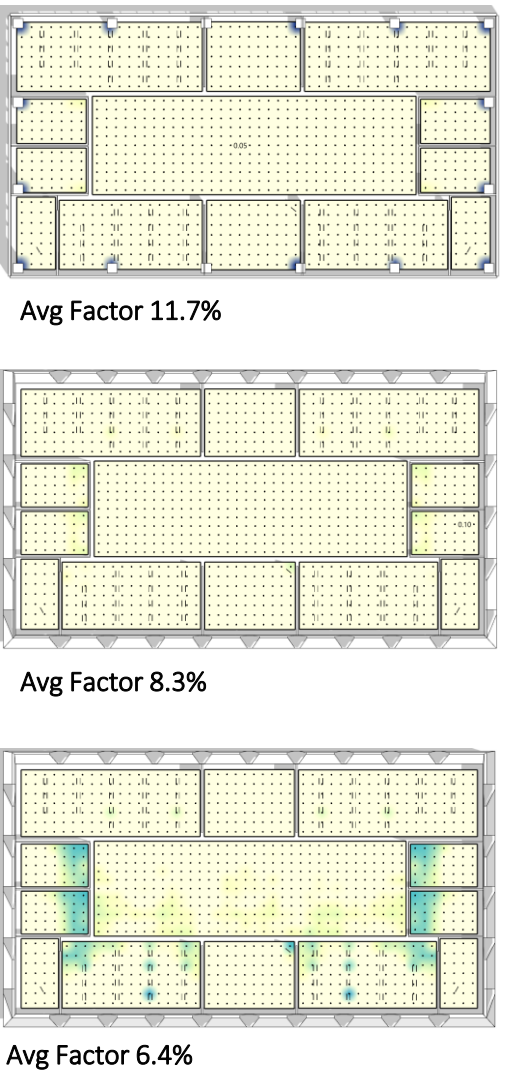

LEED v4.1

EN 17037

MVP > 3%

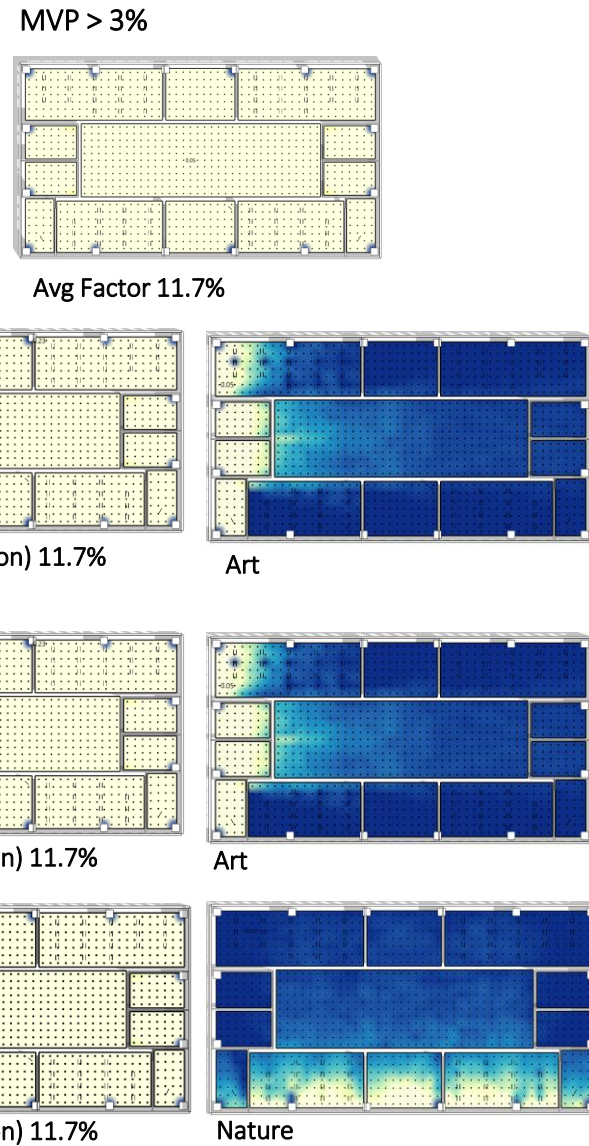

Feature Comparison

External object too close to façade receives low score

External object too close to façade receives low score

Concluding Thoughts

- From a **design computation** perspective, we have the capabilities to predict and combine aspects of view content, access and clarity in real time.
- Existing metrics have **conflicting messages**.
- Minimum view potential is promising for design applications but needs further validation as a higher rent \neq high occupant satisfaction.
- We need **coordinated human subject studies** to validate and compare existing metrics against.

Thank You
